For all - Rx - Antirobe Tablet - 75mg - BID

### ANTIROBE® (clindamycin hydrochloride) Capsules and Aquadrops® Liquid

### Penetration Power for Fast, Safe Healing

Break through infection barriers with ANTIROBE® (clindamycin hydrochloride) antibiotic products. ANTIROBE quickly penetrates to the source of the infection for superior results in common skin infections as well as dental and deep-wound infections and osteomyelitis.

#### Indications

For the treatment of dogs with **skin infections (wounds and abscesses)** due to coagulase positive staphylococci (*Staphylococcus aureus* or *Staphylococcus intermedius*). **Deep wounds and abscesses** due to *Bacteroides fragilis*, *Prevotella melaninogenica*, *Fusobacterium necrophorum* and *Clostridium perfringens*. **Dental infections** due to *Staphylococcus aureus*, *Bacteroides fragilis*, *Prevotella melaninogenica*, *Fusobacterium necrophorum* and *Clostridium perfringens*. **Osteomyelitis** due to *Staphylococcus aureus*, *Bacteroides fragilis*, *Prevotella melaninogenica*, *Fusobacterium necrophorum* and *Clostridium perfringens*.

- Soft-tissue infections: Wounds and abscesses at skin surface, in subcutaneous tissue and deep tissue
- Osteomyelitis: Compound fractures, open fracture reductions and sequestrae
- Anaerobic infections: Penetrating wounds, abdominal traumas, bite wounds, necrotic tumors, foreign bodies and post-surgical infections
- Periodontal disease: Gingivitis, periodontitis and osteomyelitis

#### Key Features

- **Excellent mode of action/Appropriate spectrum of activity:**  
Clindamycin, the active ingredient in ANTIROBE® products, is a unique and highly effective antibiotic. It safely and quickly accumulates at the site of infection while it maintains high concentrations that fight susceptible aerobic and anaerobic bacteria.
- **Fast-acting:**  
ANTIROBE attaches to white blood cells for rapid delivery to the infection site. It reaches effective levels in as little as 15 minutes. Attachment to white blood cells also ensures a high concentration of bacteria-killing power.
- **Highly effective in pus-filled infection sites:**  
ANTIROBE breaks through the barriers and gets to the site of infection.
- **Excellent penetration of soft tissue and bone:**  
ANTIROBE is carried to the site by one of the main types of blood cells that consume and remove foreign material in the body. And unlike antibiotics that are repelled by bacterial slime, ANTIROBE can penetrate the layer of protective enzymes of mixed bacteria around bones.

## DENTAL CHART FOR DOGS

### General Information

The baby (deciduous) teeth begin to appear (erupt) at about 4-5 weeks of age and are completely in by 6-8 weeks. Puppies begin to lose their baby teeth at about 4 1/2 months of age, just before the permanent teeth begin to appear. By 6-7 months of age, all the permanent teeth have erupted.

The types of teeth are incisors, canines (fangs), premolars and molars. Dogs have 28 baby teeth and 42 permanent teeth.

### Information Regarding Your Pet

\* Teeth that are missing or have been extracted are marked with an X.

\* Teeth that have been extracted during this visit: see chart below.

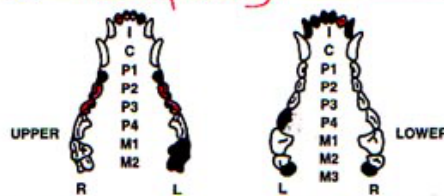

\* The teeth and gums are in good/fair/poor health.

\* Recommendations for future treatment or preventive dentistry:

Can try wiping teeth/gums 2x weekly using household mouthwash & gauze sgs.

### CANINE DENTAL RECORD

FOR Dreping
